TITLE: Effect of rocket firing on the operation of turbojet engine, 23

SOURCE: Wojskowy przeglad lotniczy, no. 8, 1963, 22-26

TOPIC TAGS: turbojet engine, rocket firing, fuel feed, reverse engine start, gas temperature, firing altitude

ABSTRACT: In order to obtain high thrust in a turbojet engine it is necessary to use multistage axial compressors with a high output G kg per sec and high compression with rocket firing, however, this may cause engine disturbances because the flow of combustion and explosion gases affects the engine dynamically, thermally and chemically. The temperature increase causes a drop in the total compression of the compressor which in turn causes a reduction in axial velocity at the first compression stages and an increase in the angle of incidence on the blades of these stages. This causes an automatic drop in the engine rotational velocity, and an increase in the fuel feed to the combustion chamber.

||

Card 1/6

L 18808-63

ACCESSION NR: AP3005963

Moreover, rocket firing causes in a chamber a reduction in oxygen content from 21% to 15-18% which results in a rapid deterioration of the combustion process. In order to counteract this during rocket firing it is not enough to select the optimum places of armament location as its being done in fighter aircraft. There are two generally used methods: 1) a system permitting a sudden short-time lowering of the amount of fuel fed to the combustion chamber, and 2) a system of total interruption of fuel feed with an automatic reverse engine start. When the first method is used, the temperature of combustion gases ahead of the turbine is lowered and the operating point on the compressor characteristic is moved from the region which is on the border of nonstable operation toward small compression values. This is shown on Figure 2 of Enclosure 1. The operation of the combustion chamber and the reheater also becomes more stable. This method, however, can not be used without limitations. It is because at fights close to the ceiling of the aircraft the required fuel expenditures become smaller, reaching the minimum values at which normal operation of the engine is possible. This is shown on Figure 3 of Enclosure 2. The second method is known as the reverse starting method. It is often used when firing at altitudes greater than the aircraft ceiling. This system

Card 2/6

L 18808-63

ACCESSION NR: AP3005963

requires that there be: a transmitter for connecting into the circuit the arrangement for interruption and start; a starting pump for regulating fuel expenditure according to air pressure at entrance to combustion chamber; an arrangement to feed oxygen into starter igniters; an electrical ignition circuit giving an assurance that the fuel mixture will ignite at high air pressures and high rotational speeds. This method restores the output range in 10-12 sec. without pilot's interference. There are other methods counter-acting the effect of rocket firing. Orig. art. has 3 figures and 2 formulas.

"Successful X-ray Treatment in Ulcerative Colitis. Report of Three Cases."

Warsaw, Polski Tygodnik Lekarski, Vol 17, No 52, 24 Dec 52, pp 2040-2043

Abstract: / Authors' English summary modified / In the 3 severe cases of ulcerative colitis the irradiation of the abdomen was started after all the therapeutic possibilities had failed. One of the patients (a female, N.2) was after left-side hemicolectomy; however, persistent diarrhea with large amount of blood-stained mucous-purulent excreta was observed. The X-ray treatment was successful in all three cases. A series of 12 irradiations to be performed twice a week (25r measured in air in the whole abdominal cavity at a distance of 90cm, the filter 0.5 Cu and 1.0 Al, the voltage 150 Kv), constitutes the suggested treatment. Six weeks after the series is finished 4-6 additional sessions should be performed at weekly intervals. The chest, spleen and in men the testicles were protected. The article contains four photographs and one reference.

Engineer

TITLE: Pitting on Nitrided Sliding Surfaces of Cylinder Bushings in Internal
Combustion Engines

PERIODICAL: Przegląd Mechaniczny, 1960, No. 23, pp. 698 - 700

TEXT: The article describes tests made in order to determine the cause of
pit formation on nitrided sliding surfaces of cylinder bushings made of steel type
38 HMJ. A great number of pits, some of them 1.0 mm/diameter, was noted on sliding
surfaces of cylinder bushings. These bushings are produced by forging and after
machining and hardening, were nitrided in two stages to a depth of 0.55 to 0.85 mm,
according to following specifications: first stage - temperature $510 \pm 10^{\circ}\text{C}$, hard-
ening time 20 hours, ammonia dissociation 20 to 35%; second stage - temperature
 $540 \pm 10^{\circ}\text{C}$, hardening time 35 to 50 hours, ammonia dissociation 40 to 55%. Pit ✓
formation was noted after the polishing depth of 0.15 mm was reached. The hardness
of the nitrided surface was 800 - 850 HV and after polishing 700 - 630 HV. Core
hardness ranged from 32 - 37 HRC. A number of nitrogen hardening tests were made
under variable conditions and no pitting was noted if the following parameters were
Card 1/2

A076/A026

Pitting on Nitrided Sliding Surfaces of Cylinder Bushings in Internal Combustion Engines

applied. Two-stage nitrogen hardening: for the first stage temperature should be $510 \pm 5^{\circ}\text{C}$, hardening time 25 hours, ammonia dissociation 20 - 30%, for second-stage: temperature $525 \pm 5^{\circ}\text{C}$, hardening time 50 - 60 hours, ammonia dissociation 25 - 40%. In case where single-stage hardening is necessary the following parameters should be adhered to: temperature $515 \pm 5^{\circ}\text{C}$, hardening time 75 - 85 hours, ammonia dissociation 25 - 40%. In both cases ammonia pressure was 50 ± 10 mm of water head. Ammonia was cooled off with silica gel and hardness of nitrided surface was 940 - 980 HV. In their conclusion the authors point out: pit formation arises due to crumbling of grain during the polishing process; micro-cracks appear where nitrogen grids are formed; the cause of nitrogen-grid formation is a much too high hardening temperature, i.e. $540 - 550^{\circ}\text{C}$. There are 6 photographs, 1 table, 1 figure and 2 references: 1 Polish and 1 Soviet.

THE INFLUENCE OF THE POTASSIUM IODIDE CONCENTRATION ON THE TIME OF DECAY OF THE URANINE FLUORESCENT RADIATION.

W. Szymagorski. *Bull. intern. acad. polonaise, Classe sci. math. nat.* 1935A, 24-7.—The time of decay of the uranine fluorescent radiation increases approx. linearly with the concn. of KI. The variation with the KI concn. of the reciprocal of the fluorescence efficiency is explained satisfactorily by taking into account the probability that no quenching mol. is present at the beginning of excitation within a certain "sphere of action" of the excited mol.

Title : Application of Pressed Powder Methods to the Investigations
of Infrared Absorption Spectra of Solids

Orig Pub : Bull. Acad. polon. sci. Ser. sci. mat., astron. et phys.,
1958, 6, No 3, 223-231, XVII

Abstract : The applicability of the method of pressed powders to various inorganic and organic solid bodies is considered. From the infrared spectra of many specimens, pressed in a vacuum apparatus constructed by the authors, the following is shown: 1. Samples of barium titanate, which exhibits strong ferroelectric properties prior to pulverization, and samples of barium titanate obtained in powder form, have the same absorption spectra with bands at 545 and approximately 420 cm^{-1} . 2. Polystyrol, pressed with potassium bromide, has essentially the same absorption spectrum in the infrared

A woman of 27 had been treated for the last 3 yr. with nitrogen-mustard, urethan, splenectomy and X-ray, as typical myelogenous leukaemia was diagnosed. In the course of the last remission there suddenly appeared tumours in various places and monocytoid cells in the peripheral blood (to 84%). The white blood count rose to 394,000 per cu. mm. Reticulosarcoma was diagnosed by biopsy and confirmed at the post-mortem examination.

1966. PNEUMONIA IN CHILDREN UP TO 3 YR. OF AGE. MORBID ANATOMIC-
AL STUDY - Zapalenie płuc u dzieci do lat 3. Studium anatomopatologiczne -
Szymańska D. Zakł. Anat. Patol. AM, Warszawa - ROZPR. WYDZ.
NAUK MED. POL. AKAD. NAUK. 1958, 3/2 (5-34) Graphs 1 Tables 5 Illus. 31

A study was made of 136 cases of pneumonia in newborns and young children in whom post-mortem examinations were carried out in the period 1950-1951 at the Morbid Anatomical Institute of the Warsaw School of Medicine. The ages of the children ranged between a few days and 3 yr. The conclusion is reached that the pneumonias of children in this period of life manifest themselves in the first place by interstitial alterations, irrespective of the aetiology of the disease. This also applies to multifocal pneumonias confirmed clinically and radiologically. It is not correct to consider the interstitial pneumonia in newborns and in young children separately, for it is an inevitable stage in all forms of pneumonia attacking children of this age. The pneumonia generally affects both lungs and is accompanied by lesions in other organs.

In 1063 children 7-15 yr. old, pinworms (*Enterobius vermicularis*) were most frequent: 68.39%, the curve of their occurrence depending on age and being highest (75.33%) in the group of 11 yr. Considerably less frequent were *Trichuris trichiura* (10.29%) and *Ascaris lumbricoides* (1.43%). The distribution of the parasites varies considerably from village to village. 29 children of 5-6 and 121 children of 7-14 yr., coming from another region, have been examined much more thoroughly,

778

several methods being employed and protozoa taken into account. Contrary to expectations lower percentages of the invasion by parasites have been found in peasant children of some places than in town children.

AUTHOR: Szymańska, Jadwiga

TITLE: Effect of imperfections on the temperature hysteresis of BaTiO_3

SOURCE: Poznańskie Towarzystwo Przyjaciół Nauk. Komisja Matematyczno-Przyrodnicza. Prace. v. 11, no. 1, 1961. Fizyka dielektryków. no. 1, 197 - 200

TEXT: This paper was presented on October 19, 1961, at a meeting of the Komisja Matematyczno-Przyrodnicza PTPN (Mathematical and Scientific Committee, PTPN). Ceramic disks of BaTiO_3 , pure and containing 1-8 % MgSnO_3 , were prepared by triple firing (1200 - 1320°C) and their capacitance was measured at 1 Mc/s by the resonance method. The temperature dependence of the permittivity $\epsilon = \epsilon(T)$ in the range from -30 to +180°C was deduced from the capacitance. Next the author calculated the temperature hysteresis parameters, i.e. the differences between the peak permittivities ($\Delta\epsilon = \epsilon_r - \epsilon_a$)

Card 1/2

Effect of imperfections on the ...

P/518/62/011/001/008/008
D207/D308

and the Curie points ($\Delta T = T_a - T_r$) in aged (denoted by 'a') and regenerated ('r') states. BaTiO_3 was aged by not subjecting it to high temperatures, alternating electric fields, pressure, etc. for several months; it was regenerated by heating above the Curie point. For pure BaTiO_3 and $\text{BaTiO}_3 + 1\% \text{MgSnO}_3$ $\Delta \epsilon$ and ΔT were independent of the ageing period but the presence of more than 1 % MgSnO_3 made $\Delta \epsilon$ and ΔT rise with the duration of ageing. This was due to Mg ions which enter the perovskite lattice and being small make it easier to deform the perovskite cells. The results indicate that impurities may lengthen the orientation relaxation time of the ferroelectric domains and thus stabilize the aged state. Acknowledgements are made to Professor Doctor A. Piekara, for his advice and direction of this work, and Lecturer Dr. Z. Pająk and Dr. T. Krajewski for discussing this work. There are 3 figures. ✓

Abstract: [Authors' English summary] Comparative polarographic (Brdicka test) and electrophoretic studies on the serum protein pattern were performed. A correlation between the height of the polarographic wave and the amount of alpha₂-globulins was observed. Of the 10 references, five are Polish, three German, and one each Czech and English.

Determination of alkaloids of tropeinic plants. Mirosława
Szymańska (Med. acal., Łódź, Poland). *Farm.-Polka* 9,
249-51(1953).—The influence of soil, fertilizer, climate, and
genetic changes induced by deliberate variation in cultiva-
tion conditions on the alkaloid content after harvesting
under specified conditions was detd. in *Atropa belladonna*,
Hyoscyamus niger, *Datura metel*, *D. tatula*, and *Scopolia*
lurida. The Polish Pharmacopeia II method is compared
with the method of Kuc (C.A. 46, 11580b) proposed for the
Polish Pharm. III. The Kuc method falls within the normal
limits adopted by Polish Pharm. II for folia and herba *Hyos-*
cyami and agrees closely with the Swiss Pharmacopeia,
but the results differ considerably from results obtained with
the Polish Pharm. II method. For other raw materials, the
Kuc method gave 5-15% lower results than by the Polish
Pharm. II method, perhaps caused by loss in alkaloids in re-
peated manipulations. Detn. of alkaloids in folia *metel* by
the Kuc method was not possible. Clayton F. Holoway

TITLE: Measuring thermal e.m.f. in InSb

PERIODICAL: Referativnyy zhurnal, Avtomatika i radioelektronika,
no. 2, 1962, abstract 2-4-5b (Bull. Acad. polon. sci.,
Sér. sci. math., astron. et phys., 1961, 9, no. 5,
419-421)

TEXT: The results are given of measuring thermal e.m.f. of five InSb samples with various impurity concentrations in the temperature range 100 - 400°K. The following technological method was used in measurements: The temperature difference between the two ends of the analyzed sample was measured with thermocouples, fixed directly at the sample by electrolytically deposited copper layer. The impurity concentrations were determined by measuring the Hall coefficient at the temperature of liquid nitrogen. [Abstracter's note: Complete translation.] ✓

and for $x = 0.15$, $E_g = 0.06$ eV. The photomagnetic effect was investigated at room temperature. High sensitivity to infrared radiation was established. The material with $x = 0.10$ is sensitive to radiation from the visible range to wavelength of 10 microns. It was also established that the photomagnetic effect for $x = 0.10$ depends on the frequency of incident radiation. This dependence is caused by the appearance of a thermal component (Nernst effect). The experimental results are presented in the form of curves and compared with published data. The results are discussed in detail in the light of existing literature. The authors thank Prof. L. Sosnowski for his interest in this work and discussions. The authors also thank Docent Dr. W. Wardzynski, J. Ginter, Dr. J. Mycielski, and Dr. J. Rauluszkiewicz for valuable comments they made in the course of this investigation. Orig. art. has: 7 figures.

TITLE: Dependence of organic dielectric direct current conductivity upon operating conditions and external factors

SOURCE: Przegląd elektroniki, no. 4, 1964, 190-198

TOPIC TAGS: semiconductor, solid state physics, dielectric, organic dielectric, current conductivity, direct current conductivity, polystyrene, saran, thermoplastic resin, vinyl chloride, vinylidene chloride

ABSTRACT: The results of an analysis of direct current conductivity in high-molecular organic dielectrics are discussed. These dielectrics are polystyrene and saran (vinyl chloride and vinylidene chloride copolymer). The polystyrene structure was polar; the saran structure was non-polar. Authors found that polarization occurs in both types of polymers. This polarization causes a change in the current intensity flowing through the dielectric as a function of time. The polarization processes occur at a faster rate in the polar saran than in the non-polar polystyrene, i.e. a quasi-stationary current is obtained after the passage of a smaller time interval in the case of saran. The depolarization currents, observed for both types of
